## TECH I'D LIKE TO SEE

### Combining IoT, AI & 3D printing

I would like to see IoT, 3D printing and AI coming together to create "things" for preventive health and wellness of humans. Imagine if we could create personalised hip or knee joints, or customised cancer vaccines, which target only the cancerous cells in the body and leave the healthy ones alone, or swallowable devices which can look inside our body. All of this prefabricated, but personalised and intelligent. For instance, the data from the swallowable pills can create my own medical profile, check it against millions of similar profiles and it can then predict the propensity of my contracting a specific disease in the future. Meanwhile, an

ECG, BP, pulse measuring device on my wrist is constantly monitoring me in real time and alerting both the care provider and my family/ friends in case there is an emergency. I believe this tech will go mainstream within the next 3-5 years and the world would be a much better and healthier place.
